

Automating Jetpack Compose app with Appium Espresso driver

Edvinas Liutvaitis

Flo is: an essential health partner.

You can:

Improve your **sexual health** and **enhance pleasure**.

Explore your hormones, **learn** about hygiene and safety, **and break taboos**.

Join **8M women who've conceived with the app**. **Manage pregnancy**. Plus, enjoy extra support from the Flo community.

Track your cycle with **impressive 2 days accuracy**, thanks to our AI based engine.

Engage Flo's Symptom Checker to avoid up to 12 years diagnostic delay on medical conditions that affect up to 40% of women

Prepare for what your body is about to do, learn the underlying reasons and ways to alleviate, **stay in control**.

Jetpack Compose

Modern toolkit for building native android ui.

Why?

- Less Code
- No more XML-based layouts and views
just one language
- Intuitive
- Declarative Approach
- Accelerate Development

Is, there any alternative in Appium?

Yes, there is- UiAutomator2 still useful

- Semantic tree structure helps accessibility service to understand what is on the screen.
- Jetpack compose provides semantic property called **testTag**
- Set `testTagsAsResourceId = true`

The Espresso way

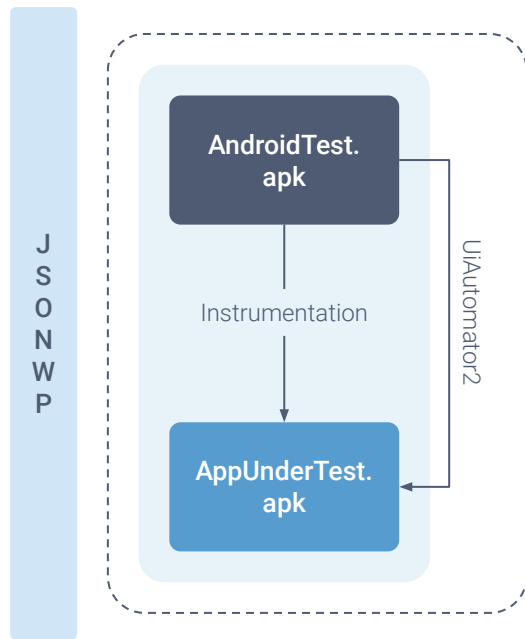

How it works high-level overview

- Android device has 2 apks
 - One for driving the device under test (AndroidTest.apk)
 - Second one is App Under Test (AUT.apk)
- Driver.apk uses instrumentation when talking with AUT.apk

Automation Code

Appium Client

Android Device

Espresso building gradle server

- Set dependencies for compose using `appium:espressoBuildConfigcapability`
 - `composeVersion`
 - `additionalAppDependencies`
 - `additionalAndroidTestDependencies`

```
{
  "toolsVersions" : {
    "gradle": "8.1.1",
    "androidGradlePlugin": "8.1.1",
    "compileSdk": "34",
    "minSdk": "31",
    "targetSdk": "33",
    "annotationVersion": "1.7.1",
    "composeVersion": "1.6.0-alpha08",
    "espressoVersion": "3.4.0",
    "kotlin": "1.9.20"
  },
  "additionalAndroidTestDependencies": [
    ~~~
  ],
  "additionalAppDependencies": [
    ~~~
  ]
}
```

Espresso to Compose: Appium Settings API

- Use settings api to switch between compose and espresso context
 - **appium:settings[driver]: “compose”** allows interaction with Jetpack Compose based application interfaces
 - Can be switched back to espresso view at any time passing **“espresso”** keyword

Backdoor extension

Using backdoor extension

- Backdoor can be invoked in tree different locations
 - Application
 - Activity
 - Element

```
{
  "target": "activity",
  "methods": [
    {
      "name": "myMethod",
      "args": [
        {"value": true, "type": "java.lang.Boolean"},
        {"value": "AI driven", "type": "java.lang.String"},
        {"value": 2, "type": "java.lang.Integer"}
      ]
    }
  ]
}
```

Things to know when using backdoor

- Only **public** methods can be invoked
- When using kotlin need to add **open** modifier
- If still not able to invoke the method check **proguard**

Demo
